J. Sholling Advivates hepatocyte growth factor (HGF) by converting
thermal single chain on a heterodimeric form (By similarity).

J. SUBCELULIAR LOCATION: Secreted as an inactive single-chain
precursor and is then activated to a heterodimeric form (By similarity).

J. SIMILARITY: Contains 1 fibronectin type II domain.

J. SIMILARITY: Contains 1 fibronectin type II domain.

J. SIMILARITY: Contains 1 kringle domain.

PTM: THE SINGLE CHAIN, ALMOST FULLY ACTIVE ENZYME, CAN BE FURTHER PROCESSED INTO A TWO-CHAIN FULLY ACTIVE FORM BY A CLEAVAGE AFTER ARG-308 CATALYZED BY FLASMIN, TISSUE XALLIKREIN OF FACTOR XA.

MISCELLANEOUS: Binds to the kringle structure of the fibrin A chain. Binding to fibrin enhances its catalytic activity. SIMILARITY: Belongs to peptidase family SI.

SIMILARITY: Contains I EGF-like domain.

SIMILARITY: Contains I fibronectin type I domain.
                                                                                                                        Eukaryota, Metazoa; Chordata, Craniata, Vertebrata; Euteleostomi;
Mammalia; Eutheria; Rodentia; Sciurognathi; Muridae; Murinae; Rattus.

RT "Generation and initial analysis of more than 15,000 full-length human and mouse cDNA sequences.", 99:16899-16903(2002).

P. C. I. FUNCTION: Converts the abundant, but inactive, zymogen plasminogen. Controlling plasmin-mediated proteolysis, it plays an important controlling plasmin-mediated proteolysis, it plays an important controlling plasminogen and degradation, in cell migration and many other physiopathological events.

C.!- CATALYTIC ACTIVITY: Specific cleavage of Arg-|-Val bond in plasminogen to form plasmin A and chain B held by a disulfide bond. -:- SUBCELLULAR LOCATION: Secreted, extracellular.
-:- PTH: THE SINGLE CHAIN, ALMOST FULLY ACTIVE ENSTWE, CAN BE FURTHER PROCESSED INTO A TWO-CHAIN FULLY ACTIVE FORM BY A CLEAVAGE AFTER ARG-308 CATALYZED BY PLASMIN, TISSUE KALLIKREIN OR FACTOR XA.
-:- MISCELLANDEDUS: Binds to the kringle structure of the fibrin A chain. Binding to fibrin enhances its catalytic activity.
-:- SIMILARITY: Conteains 1 EGF-like domain.
-:- SIMILARITY: Conteains 1 EdF-like domain.
-:- SIMILARITY: Conteains 2 kringle domains. EMBL; J03520; AAA40470.1; -.

MEDINE-9290785; Pactor XII is a serum glycoprotein that participates in the initiation of blood coagulation, fibrinolysis, and the the initiation of blood coagulation, fibrinolysis, and the the initiation of blood coagulation, fibrinolysis, and the the initiation of blood coagulation, fibrinolysis, and the the initiation of bradykinin and amgiotensin.

CC -1- CFALMYTIC ACTIVITY: Cleaves Selectively Arg-|-1le bonds in factor VII to form factor VII and factor XI to form factor XIa.

VII to AND MOLYCOSYLATED.

CC -1- DISEASE: Defects in F12 do not cause any clinical symptoms. The sole effect is that whole-blood clotting time is prolonged.

CC -1- DISEASE: Defects in F12 do not cause any clinical symptoms form a complex bound to an anionic surface. Prekallikrein is cleaved by factor XII to form kallikrein, which then cleaves factor XII and then to beta-factor XIIa. Alpha-factor CC XIIa activates factor XIIa.

CC -1- SIMILARITY: Contains 1 fibronectin type II domain.

CC -1- SIMILARITY: Contains 1 fibronectin type II domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This SWISS-PROT entry is copyright. Int. Dairy J. 5:605-617(1995).

-!- FUNCTION: Converts the abundant, but inactive, zymogen plasminogen to plasmin by hydrolyzing a single Arg-Val bond in plasminogen. By controlling plasmin-mediated proteolysis, it plays an important role in tissue remodeling and degradation, in cell migration and many other physiopathological events.

-!- CATALYTIC ACTIVITY: Specific cleavage of Arg-|-Val bond in plasminogen to form plasmin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Ravn P., Berglund L., Petersen T.E.; "Cloning and characterization of the bovine plasminogen activators uPA

Biochemistry 16:2270-2278(1977).

Le FUNCTION: Pactor XII is a serum glycoprotein that participates in the initiation of blood coagulation, fibrinolysis, and the generation of bradykinin and angiotensin.

C. OTALNITC ACTIVITY: Cleaves selectively Arg-|-11e bonds in factor VII to form factor VII a and factor XI to form factor XII.

THISCELIAMBROUS: Factor XII, prekallikrehn, and HWW kininogen form a michoic surface. Prekallikrehn is cleaved by factor XII and then to beta-factor XIII a cleaved by factor XII a fortor XIII and then to beta-factor XIII a cleaved by factor XIII and then to beta-factor XIII a cleaved only to alpha-factor XIII as it lacks the trypsin/

C. SIMILARITY: Contains 2 EGF-like domains.

C. SIMILARITY: Contains 1 fibronectin type II domain.

C. SIMILARITY: Contains 1 fibronectin type II domain.

-!- SUBUNIT: Monomer.
-!- DOMAIN: The fibronectin type-I domain mediates binding to fibrin, and the kringle domain apparently mediates fibrin-induced stimulation of activity.
-!- SIMILARITY: Belongs to peptidase family $1.
-!- SIMILARITY: Contains I EGF-like domain.
-!- SIMILARITY: Contains I fibronectin type I domain.
-!- SIMILARITY: Contains I fibronectin type I domain.

-!- CATALYTIC ACTIVITY: Specific cleavage of Arg-|-Val bond in plasminogen to form plasmin.
-!- SIMILARITY: Belongs to peptidase family S1.
-!- SIMILARITY: Contains 1 EGF-like domain.
-!- SIMILARITY: Contains 1 kringle domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    InterPro; SU1.231, 1.

                                                                                                                                                                                                               "Bovine urokinase-type plasminogen activator and its receptor: cloning and induction by retinoic acid."; Gene 125:177-183(1993).
                                                                                                                                                                                                                                                                                                                                                                                                                                                    Int. Dairy J. 5:605-617(1995).
-!-CATALYTIC ACTIVITY: Specific cleavage of Arg-|-Val bond plasminogen to form plasmin.
-!- INDUCTION: By retinoic acid.
-!- SIMILARITY: Belongs to peptidase family $1.
-!- SIMILARITY: Contains 1 EGF-like domain.
-!- SIMILARITY: Contains 1 kringle domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                CHAIN A (BY SINILARITY).
